

Address-IT Letter

A Powerful Tool for Quickly Matching Addresses

Address-IT® Letter is the address entry tool in ISW's Address-IT product range. Utilising the Australia Post PAF® (Postal Address File) and the AMAS® certified Address-IT engine, it provides a quick and accurate way to enter addresses into any application.

Benefits

Clever search capabilities and "Type Ahead" mean that addresses can be entered faster than by simply typing the address. More importantly addresses are entered fully and accurately, along with any required additional address details such as barcodes or DPIDs® (Delivery Point Identifiers).

Searching

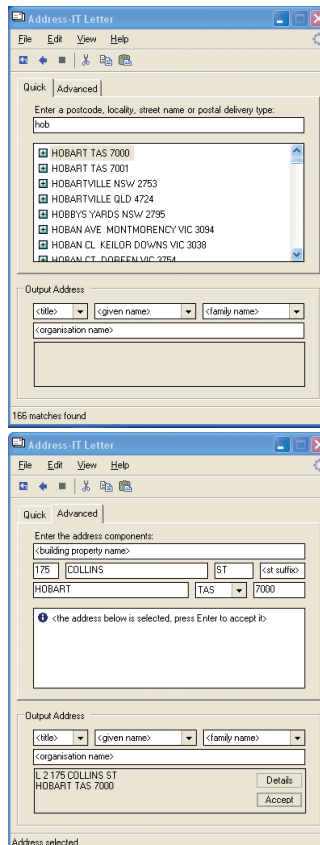

There are two ways to find addresses: Quick search and Advanced search.

Quick search provides a quick and easy way to find the majority of addresses. Searches are made using a "bottom-up" approach, meaning you start searching by typing address components such as postcode or locality, before entering more specific information like street numbers.

Advanced search is a more powerful search useful for finding problematic addresses. Searches are made using individual components and you can search using wildcards, a useful feature for incomplete/illegible addresses. You can also search using building/property names, for example the name of a school or hospital.

Integration

Once an address has been found, it can be returned to any of your application windows. The easy-to-use layout wizard enables you to specify exactly what address details to return and in what format your application requires them. You can define multiple layouts suitable for different applications or for different windows within an application. Which layout is used can be decided based on the application window's title, the hotkey shortcut used to open Address-IT Letter or by user choice at the time of returning the address. To enable even more complete integration with your applications, Address-IT Letter can also be called directly using a straightforward API.

Address-IT® Letter is the address entry tool in ISW's Address-IT product range.

Key Features:

Australia Post AMAS Approved and certified software

Maximise discounts on Postage for barcoded mail items

Enhance address quality

Easily integrates into any application both Windows and "green screen emulation sessions"
